Waste materials such as decaying food stuff provide nutrition for mosquitoes

Discarded tires, flower pots, bottles and other items catch rainwater and create a viable environment for mosquitoes to breed

> How poor waste management results in an increase in mosquito borne diseases

Diseases such as Malaria,
Dengue Virus and many
others are steadily rising
due to the increase in
mosquito populations as
they are mosquito borne
diseases

The CO2 emission released when waste materials are burned in open spaces which attract Mosquitoes
