Abstract

This research aims to study the relationship between the peak percentages on relativity humidity using experimental research methods. By selecting a specific target audience Is the forest beside the garage Bueng Khong Longwitthayakhom School, an area of 30 * 30 meters and the research instruments used in the experiments are densimeters and air humidity meters.

The statistics used for data analysis are: The data was analyzed by searching for percentages (Percentage). The results showed that if the percentage of the summit is greater, the relative humidity of the air is higher. In conclusion, the relationship between the percentage of the summit and the relative humidity was studied. It can be used to apply knowledge to plantings to maintain the ecological balance. And environmental conservation can achieve the goals

Acknowledgment

This research was successful. Because they have received great advice and

assistance from Ms. Suthirat Srisongkram, Mr. Nirapai Saithichai, Ms. Phonnapa Phosri, who the researcher was deeply grateful and grateful. We would like to give our thanks very much on this occasion.

The researcher would like to thank the public and private sectors for helping open the agency as a learning place for students of BuengKhongLongb Wittayakom School.

Thank you to the school administrators. Faculty of BuengKhongLong Wittayakom School and

..... That provide assistance in collecting information as well And thank you

..... Academic year 2020 that is used as a very experimental and informative one. Making this research a success as well

Finally, I would like to thank all family members for their support, assistance and great encouragement in every step of the process. And thank you to many other helpers who can't all say their names here.

Value and benefit from this research Researchers would like to give gratitude to parents, parents, as well as all benefactors.
