## **Human Sundial Activity**

A quick Google search will turn up many blogs and activities on making a human sundial (e.g., from <u>Crayola</u>, <u>Science Made Simple</u>, <u>Rhythms of Play</u>).

Materials Needed:

Compass or compass app on phone (for initial set-up) Chalk (sidewalk chalk works best) Measuring tape or meter stick Clock, watch or phone Pencil and Data Sheet

## <u>Set up:</u>

- 1. Choose a sunny day for the activity.
- 2. Find an open space that will be sunny all day (e.g. parking lot, sidewalk, playground). If students are doing this in teams, each team will need 10-20 feet between them.
- 3. Place an 'X' on the spot the student will stand.
- 4. Around the X draw a small circle (~2ft in diameter) and mark North, South, East, West.

## Activity Steps:

- 1. Have a student stand on the 'X'.
- 2. Trace around their shadow.
- 3. Inside the traced shadow write the time.
- 4. Measure the length of the shadow.
- 5. Record observations on your data sheet or in a science notebook.
- 6. Take photos!
- 7. Repeat this process at least 4 times over the course of the day. Make sure the same student stands on the 'X' for each measurement.

Questions to Consider During the Experiment:

- 1. Describe your shadow (long, short, skinny, fat, etc.)
- 2. What do you think your shadow will look like next time?

Questions to Consider After the Experiment (from Rhythms of Play blog above)

- 1. How do you think shadows are made?
- 2. What did you observe about your shadow and the sun?
- 3. Did the sun move? If yes, which direction?
- 4. In what direction did your shadow move?
- 5. Are the tracings the same? Why or why not?
- 6. When was your shadow the longest? When was it the shortest?
- 7. Why do you think that your shadow changes throughout the day?
- 8. Do you think that your shadow also changes throughout the year?
