Bottling a Water Sample for Classroom Testing

Field Guide

Task

Bottle a water sample to take back to the classroom for testing pH, conductivity or salinity, alkalinity, and nitrate.

What You Need

- □ 500-mL polyethylene bottle with lid
- Permanent marker
- Masking tape
- Latex gloves

In the Field

- 1. Label a 500-mL polyethylene bottle with your school's name, the teacher's name, the site name, the date and time of collection.
- 2. Rinse the bottle and cap with sample water 3 times.
- 3. Fill the bottle with sample water until the water forms a dome shape at the top of the bottle so that, when the cap is put on, no air is trapped inside.
- 4. Put on the cap and seal the cap of the bottle with masking tape.

Note: Tape serves as a label, and an indicator of whether the bottle has been opened. Tape should NOT be in contact with the water sample itself.

- Store these samples in a refrigerator at about 4° C until they can be tested (within 2 hours for pH and nitrate and within 24 hours for alkalinity and salinity or electrical conductivity).
- 6. Once the seal is broken, first do the test for salinity or electrical conductivity, then pH, then nitrate test, and then alkalinity. The sample will need to reach 20° 27° C before testing for electrical conductivity. Ideally, all the measurements should be performed during the same lab session.
