

Activity 2 – Look at the Buds

1) On a branch of your tree mark 4 buds:

- always start from the end of the branch
- use permanent marker or tape
- take a picture of all 4 buds

2) Observe the buds twice a week:

- For each bud, record at what stage it is:
 - “dormant” if the bud is unchanged.
 - “swelling” if the bud is getting bigger.
 - “budburst” the first day you see the green tips of leaves.
 - “lost” if the bud or leaf gets lost or damaged.

Tree and Shrub Green-Up					
Date (day & month)	Leaf 1 (dormant, swelling, budburst, leaf length (mm))	Leaf 2 (dormant, swelling, budburst, leaf length (mm))	Leaf 3 (dormant, swelling, budburst, leaf length (mm))	Leaf 4 (dormant, swelling, budburst, leaf length (mm))	Data entry ✓

- When you see that the bud is swelling, observe it every day, so that you do not miss the date of budburst
- Share the date of budburst at the [Discussion forum](#).
- Do not forget to continue taking pictures of your tree using [GrowApp](#)
- After the bud opens, continue to measure the length of the leaf (this will be the Activity 3)

3) Optional: Record temperature and precipitation

If you have an Atmosphere site nearby, keep recording temperature and precipitation data along with observing the buds and see if there is any link.

The activity should be completed by April 10th.

 To earn a Collaboration badge, share the date of budburst

 Students can take turns observing a tree near the school or observe their own trees. Use online tools such as [Padlet](#) or [Wakelet](#) to share pictures and results in your team.

Carbon Activity 2 – Carbon Around Me

Your students already know that trees need carbon to build their body. In the 2nd carbon activity they will:

- Learn about the existence of the carbon cycle and its main parts.
- Discuss, what carbon pools and fluxes (flows) can be found in your area.
- Think about local sources of carbon.

Basic information

Carbon is the basic building block of life. Carbon atoms are found everywhere on Earth. Carbon accounts for 45-50% of the total mass of the biosphere and is also stored in the ocean, the atmosphere, and the crust of the planet. A carbon atom could spend millions of years moving through Earth in a complex cycle.

The global carbon cycle characterizes the movement of carbon between Earth's spheres. It is a key regulator of Earth's climate system and is central to ecosystem function.

Carbon Around Me Activity

- Watch an animation that provides an illustration of the various parts of the Carbon cycle: <https://svs.gsfc.nasa.gov/10494> (created by NASA/Goddard Space Flight Center/UMBC). In the animation, purple arrows indicate the uptake of Carbon; yellow arrows indicate the release of Carbon.
 - Let your students think and discuss about carbon release and uptake of carbon in your surroundings. Are there any major sources of carbon? Are there any pools?
 - Create a carbon map of your neighborhood based on the results of your discussion. You can use the map from the next page or create your own.
 - Use a different color for uptake and for release flows.
 - Add a legend on the map.
- Share the map on the [Discussion forum](#).

Optional

- Think about your role in the carbon cycle. Which of your activities contribute to the carbon production?
- With older students do research about carbon cycle sources and storage in your neighborhood.

 Create an online Activity book with an online map and results of your research and discussion using [Book Creator](#) or another online tool. Share the result on the campaign [discussion forum](#).
