Green-Down Protocol

**Purpose**
To observe plant green-down and report green-down data to help validate estimates of the end of the plant growing season.

**Overview**
Students monitor the change in color of selected leaves of trees, shrubs or grasses.

**Student Outcomes**
Students will learn to,
- observe when leaves change color at the end of the growing season;
- compare leaf color with colors in the Plant Color Guide;
- identify tree species native to your area;
- examine relationships between green-down and climate factors;
- predict when the end of the growing season will occur for upcoming seasons;
- compare color changes of different plant species;
- communicate project results with other GLOBE schools;
- collaborate with other GLOBE schools (within your country or other countries); and
- share observations by submitting data to the GLOBE science database.

**Science Concepts**

**Earth and Space Sciences**
Weather changes from day to day and over the seasons.
The sun is a major source of energy at the Earth’s surface.

**Life Sciences**
Organisms have basic needs.
Organisms can only survive in environments where their needs are met.

Organisms’ functions relate to their environment.
Organisms change the environment in which they live.
Earth has many different environments that support different combinations of organisms.
Plants and animals have life cycles.
Energy for life derives mainly from the Sun.
Living systems require a continuous input of energy to maintain their chemical and physical organizations.

**Scientific Inquiry Abilities**
Estimating dominant plant species.
Identifying plant species (advanced level).
Observing leaf growth.
Making leaf measurements.
Identify answerable questions.
Design and conduct scientific investigations.
Use appropriate mathematics to analyze data.
Develop descriptions and predictions using evidence.
Recognize and analyze alternative explanations.
Communicate procedures, descriptions, and predictions.

**Time**
30 minutes excluding travel time

**Level**
All

**Frequency**
At least twice a week beginning two weeks prior to the anticipated start of green-down, continuing until plant color change has ended or leaves have dropped off.
**Materials and Tools**

Grass Green-Down Field Guide and/or Tree and Shrub Green-Down Field Guide

Tree and Shrub Green-Up and Green-Down Site Selection Field Guide and/or Grass Green-Up and Green-Down Site Selection Field Guide

Tree, Shrub, and Grass Green-Down Data Sheet

Green-Up and Green-Down Site Definition Sheet

Flagging tape, 1 label per student

Compass

Camera

Pencils

GLOBE Plant Color Guide

Fine-tip permanent marker

**Preparation**

Review dominant plant species of school’s GLOBE Study Site.

**Prerequisites**

Estimating Cloud Cover: A Simulation (from the Atmosphere Investigation) (suggested)
Defining Your Site For Greening (Green-Up and Green-Down)

Before selecting a site for Greening (Green-up and Green-down) measurements, here are some things to consider.

1. Plant phenology observations should be made in an area where green-up and green-down of native plants is due to climatic factors such as increased temperature or precipitation. Watering and fertilization alter plants’ greening cycles, and the data would not be representative of natural vegetation and local climate connections. Buildings absorb solar radiation and shelter sites from wind. Therefore, avoid sites near buildings or where watering or fertilization is done. For the phenology protocols, near means that the plant is closer to a building than the height of the building. To determine if the plant is too close to a building, stand at the plant and sight the top of the building through a clinometer. If the angle is greater than 45˚, the building is too close.

2. Non-native species, called exotics, have green-up and green-down cycles that may not be tied to the local climate. Often this is because exotics have not evolved to survive in the local climate. If you are unsure which plants are natives or have evolved to grow in a climate regime similar to yours, ask a local greenhouse or agricultural extension agent, or the appropriate staff at a local college or university.

3. Your green-up and green-down site must be accessible so that students can visit the site at least twice a week. It may be the same as a Land Cover Sample Site or your Atmosphere Study Site. Be sure to determine the location of your site by identifying the latitude, longitude and elevation following the GPS Protocol.

4. Because the results of your green-up and green-down measurements may be related to temperature and precipitation data from the Atmosphere Investigation and soil moisture and temperature data from the Soil Investigation, it is better to choose a site close to the Atmosphere and Soil Moisture Study Sites. The local topography can cause weather to vary even within short distances. This is particularly true in mountainous and coastal regions. The horizontal distance between the Phenology and Atmosphere and Soil Moisture Sites should be less than 2 kilometers and the elevation differences less than 100 meters, so that you can see whether your atmosphere data correlates with your green-up and green-down data.

5. Green-up and green-down detected by satellites are influenced mostly by a few dominant overstory plant species. These will be the species with the largest share of canopy coverage. If you are using a Land Cover Sample Site, you already know the dominant species. If you are using a different site, use the one to three over-story species that are dominant for your region. These over-story plants may be coniferous trees, broadleaf trees, broadleaf shrubs, or grasses. For phenology measurements you should choose a deciduous plant so, if the dominant plant species are all evergreen conifers, use the under-story broadleaf shrubs as your green-up plants. For example, if your study site is 90 percent white pine (a coniferous tree) and 10 percent sugar maple (a broad leaf tree), use the sugar maple trees as the study plants.

6. Scientifically, it is most useful if the tree or shrub branch used for the Green-Up Protocol is the same as the one used for the Green-Down Protocol. However, you may do only the green-up or green-down measurements or you may use different branches or even different sites if this is necessary to match your educational requirements. If you use different sites for green-up and green-down, create a site definition for each.

7. Since a change in plant growing season may be due to a change in climate, students at your school should try to use the same site, the same plant species, and the same part of the plant consistently, year after year.
Tree and Shrub Green-Up and Green-Down Site Selection
Field Guide

Task
Define the site for green-up and green-down measurement of trees and shrubs.

What You Need
- Site Definition Sheet
- GPS Data Sheet
- GPS Protocol Field Guide
- Flagging tape or other durable identification
- Dichotomous keys and/or other local species guides
- GPS receiver
- Compass
- Pencil or pen

In the Field
1. Complete the Site Definition Sheet.

2. Select one tree or shrub. The tree or shrub should be among the dominant native species in your area, deciduous, and easily accessible.

3. Select a healthy and relatively large branch on the south side of the plant in the Northern Hemisphere or the north side of the plant in the Southern Hemisphere. Use a compass or GPS receiver to determine direction. If a lower branch is chosen, it should be on the edge of the stand of trees or shrubs since branches inside a stand may experience a different microclimate due to shading.

4. Identify genus and species using field guides or the help of plant specialists. Record the genus and species on the Site Definition Sheet.

5. Mark the branch with flagging tape or some other durable identification. Label the flagging tape with a unique number and your name/group name, school name and class.

6. Take a GPS measurement following the GPS Protocol.
Grass Green-Up and Green-Down Site Selection
Field Guide

**Task**
Define the site for green-up and green-down measurement of grasses.

**What You Need**
- Site Definition Sheet
- GPS Data Sheet
- GPS Protocol Field Guide
- GPS receiver
- Pencil or pen
- Nails or stakes or other durable identifiers
- Meter stick or tape measure
- Dichotomous keys and/or other local species guides

**In the Field**
1. Complete the Site Definition Sheet.
2. Identify genus using field guides or help of plant specialists. Record the genus on the Site Definition Sheet.
3. Select a one-meter square area dominated by grass plants. Mark your one-meter square plot with nails or stakes or other durable identifiers.
4. Take a GPS measurement following the GPS Protocol.
Teacher Support

Advance Preparation
Students should complete the Estimating Cloud Cover: A Simulation Learning Activity in the Atmosphere Investigation prior to observing green-down. Students will estimate percentage of leaf colors in the green-down observations.

Students should start their observations at least two weeks before expected green-down.

Frequency of Observations
For most areas of the world, there is only one green-up and green-down cycle. However, there are places where multiple wet and dry seasons can occur in a single year, resulting in multiple green-up and green-down cycles. Because of this possibility, we are asking you to report which cycle you are observing. If there is only one cycle, then you report green-down cycle 1. The onset of the first green-down after 1 January is considered green-down cycle 1.

Measurement Procedure
If lower branches are observed, try to sample them from the edge of the stand of trees or shrubs since branches inside a stand may experience a different microclimate due to shading.

In some locations, the end of leaf color change will mark the end of the reporting period.

For each observation, students record the color of the leaf using the GLOBE Plant Color Guide, or if the leaf has fallen or been snow covered. If a leaf has fallen, then no more observations can be made for that leaf. Depending on the snow event, reporting may end as well. The following page shows an example of a completed Data Sheet.

Questions for Further Investigation
What other animals (butterflies, waterfowl, songbirds) migrate after plants green-down? When? Why?

Does the timing of green-down occur earlier or later at higher elevations in your region? Why?

Does the timing of green-down occur earlier or later inland or near the coast in your region? Why?

How do fallen plant leaves affect soil properties such as soil color, water-holding capacity, and soil nutrients? How could you find out? Why is this important?
Example of Completed Green-Down Data Sheet

GLOBE® 2014  Green-down Protocol - 7  Biosphere
Tree and Shrub Green-Down Protocol
Field Guide

Task
Observe and record green-down in trees or shrubs.

What You Need

First visit only
- Tree, Shrub, and Grass Green-Down Data Sheet
- Pencil or pen
- Camera
- Compass
- Fine-Tip Permanent Marker
- GLOBE Plant Color Guide

Every visit
- GLOBE Plant Color Guide
- Pencil or pen
- Tree, Shrub, and Grass Green-Down Data Sheet

In the Field

First visit only/getting started

1. Complete the upper portion of your Data Sheet.
2. Determine whether there are more than one green down cycles; if yes, during which cycle are you currently collecting data (1, 2, or 3)?
3. Locate the leaf at the end of the branch. Label this leaf by marking one dot on the branch next to the leaf stem or petiole. Locate the three other leaves on this branch closest to this terminal leaf.
4. Label these leaves by marking two, three, or four dots next to their stems on the branch.
5. Take a photograph looking in the north, south, east, and west directions.

Every visit

1. Examine each of your four leaves. For each leaf, use the GLOBE Plant Color Guide to estimate the dominant color of each leaf. For example, if leaf 1 appears colored at 60 percent 5G 7/12 and 40 percent 2.5 Y8/10, record the leaf color as 5G 7/12 for that observation date.
2. Record your observations on the Tree, Shrub, and Grass Green-Down Data Sheet.
   - If leaf is snow covered, report “snow covered”,
   - If leaf has fallen, report “fallen” and stop reporting after that,
   - Otherwise, continue to report the color until the color stops changing.
Grass Green-Down Protocol
Field Guide

Task
Observe and record green-down in grasses.

What You Need

First visit only
- Tree, Shrub, and Grass Green-Down Data Sheet
- Pencil or pen
- Camera
- Compass
- Fine-Tip Permanent Marker
- GLOBE Plant Color Guide

Every visit
- GLOBE Plant Color Guide
- Pencil or pen
- Tree, Shrub, and Grass Green-Down Data Sheet

In the Field

First visit only/getting started
1. Fill in the top of your Data Sheet.
2. Determine whether there are more than one green down cycles; if yes, during which cycle are you currently collecting data (1, 2, or 3)?
3. Look for the four longest green grass shoots.
4. Mark the base of the longest grass shoot with a single dot. Mark the second longest shoot with two dots, the third with three dots and the fourth shoot with four dots.
5. Take a photograph looking in the north, south, east, and west directions.

Every visit
1. Examine each of your four grass shoots. For each shoot, use the GLOBE Plant Color Guide to estimate the dominant color percentage of each shoot. For example, if shoot #1 appears colored at 60 percent 5G 7/12 and 40 percent 2.5 Y8/10, record the shoot color as 5G 7/12 for that observation date.
2. Record your observations for each shoot on the Tree, Shrub, and Grass Green-Down Data Sheet.
   - If leaf is snow covered, report “snow covered”.
   - If leaf has fallen, report “fallen” and stop reporting after that.
   - Otherwise, continue to report the color until the color stops changing.
Frequently Asked Questions

1. Should I use the same leaves I used for green-up?
If possible, use the same branches or grass plot. If you use other plants try to select plants of the same species. If the plants you use for green-down are at a different location than the ones you used for green-up, then define a new site.

What do scientists look for in the data?

Scientists are very interested in when leaves appear in spring and how quickly they expand. The timing and rate of fall leaf changes, such as color changes and leaf drop, are also important. It may seem strange that such easy to observe and common events are important for Earth System Science, but they are. These plant phenological events are directly related to global carbon fixation and the amount of carbon dioxide in the atmosphere. Also they affect and are affected by air temperature and humidity and soil moisture.

For example, many scientists use data from a NASA sensor, the Moderate Resolution Imaging Spectrometer (MODIS), to monitor the seasonal dynamics of vegetation. Green-up/green-down data gathered by GLOBE students, using consistent methods all over the world, are one of the best tools with which to verify the accuracy of these satellite products.

Computer models are one of the main research tools used by scientists to predict the future climate of the planet. Seasonal vegetation patterns and activity is an important component of this research. Many models contain programs that are used to predict the expansion of plant leaf material. Without data against which to compare these models, we cannot believe the model predictions. By using GLOBE green-up/green-down data to help develop these models, scientists will be able to better predict our future climate.

Some applications of GLOBE data can be very specific, in particular when plant phenology is linked to other events. Many plant pests like gypsy moths appear during certain leaf developmental stages. By linking GLOBE green-up data with the appearance of gypsy moths, scientists are working to develop better pest treatment approaches.

In short, by participating in the GLOBE Green-Up and Green-Down Protocols, you will be helping to gather data that scientists will use in many fields of Earth System Science, sometimes in unpredictable ways!
