

Protocol Training Slides: Relative Humidity

Relative humidity found in our atmosphere,
as observed by satellites of the [GOES project](#).
The gray and white regions are clouds. *Image: NOAA*

Overview and Learning Objectives

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

Overview

This module:

- Describes relative humidity
- Provides step-by-step protocol instructions for collecting relative humidity

Learning Objectives

After completing this module, you will be able to:

- List some reasons to collect relative humidity
- Describe how, where, and when to collect relative humidity
- Upload data to the GLOBE website
- Visualize data using the GLOBE Visualization Site and formulate your own questions about weather

Estimated time needed to complete this module: 1.5 hours

Overview and Learning Objectives

Materials

- [Atmosphere Investigation Data Sheet](#) OR instructions for using GLOBE Observer to record data can be found in the [Data Entry section](#)
- Digital hygrometer or sling psychrometer (with chart - [see example](#))
- Calibrated thermometer
- Watch or timer

- A. What is relative humidity?
- B. Why collect relative humidity data?
- C. How your measurements can help!
- D. How to collect your data.
- E. How to report data to GLOBE.
- F. Understand the data.
- G. Quiz yourself!
- H. Further resources.

The Atmosphere

- Extremely thin blanket of air extending about 300 miles from Earth's surface to edge of space
- Contains water vapor, an important part of hydrologic cycle

Image: NASA

[**Link to the GLOBE Atmosphere Protocols**](#)

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

Relative Humidity

A. What is relative humidity?

B. Why collect relative humidity data?

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

- Measures the amount of water vapor in the atmosphere (humidity) relative to the maximum amount of water vapor that the atmosphere could hold at the same temperature
- Affects the heating and cooling of air
- Warm air can hold more water vapor and the saturation point of the air is higher than for cold air
- Water vapor has the strongest impact as a greenhouse gas
- Specific humidity refers to the actual amount of water vapor in the air

Measuring Relative Humidity

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

- MODIS (or Moderate Resolution Imaging Spectroradiometer)
- Key instrument on the Terra and Aqua Satellites
- Views the entire Earth's surface every 1 or 2 days
- Helps in understanding the global dynamics and processes of the lower atmosphere over land and water
- Check out the [MODIS Image of the Day](#)

NASA's Terra satellite

NASA's Aqua satellite

Recording Relative Humidity (RH) is important for many reasons:

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

- Taking RH measurements helps us understand how quickly water will move from the surface of the Earth to the atmosphere and then back to Earth.
- RH measurements are important in classifying an area as arid (dry), or humid (moist).
- RH influences when clouds will form and when precipitation will fall.
- The amount of water in the atmosphere is one of the determining factors in the weather and climate in an area.
- RH affects the heating and cooling of the air.
- Because of its high heat capacity, water vapor can greatly change the rate that air masses change temperature.

Why It Matters

- *Your observations are valuable contributions to the scientific community and may be used by educators, students, researchers, and the general public to increase environmental awareness and STEM literacy, as well as advance Earth system science.*

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

What I Need to Collect RH Data

- A. What is relative humidity?
- B. Why collect relative humidity data?
- C. How your measurements can help!
- D. How to collect your data.
- E. How to report data to GLOBE.
- F. Understand the data.
- G. Quiz yourself!
- H. Further resources.

<i>Instruments</i>	Digital Hygrometer or Sling Psychrometer (with chart), Calibrated Thermometer, Watch or Timer
<i>Data Sheet</i>	<u>Relative Humidity Data Sheet</u> <u>Atmosphere All Protocols Data Sheet</u>
<i>When</i>	Preferably within one hour of <u>local solar noon</u> ; OK at other times
<i>Where</i>	A good observation site (See <u>Documenting your atmosphere study site</u>) at your Instrument Shelter
<i>Other</i>	Log book for data collection; Computer with internet connection to enter data

Digital Hygrometer

Sling Psychrometer

Which Instrument do I Use?

You can use either a Digital Hygrometer or a Sling Psychrometer

- If the students have only a short period of time to take the measurements and are taking measurements in temperatures below freezing, use the digital hygrometer.
- If you have the time, the students will probably enjoy using the sling psychrometer.

It is important to note that either instrument will give data that is equally useful to scientists, teachers and student researchers. It is the choice of the teacher and students to choose the instrument they want to use.

Digital Hygrometer

Sling Psychrometer

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

Instrument Shelter

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

- Your hygrometer is placed in the instrument shelter for 30 minutes before you plan to take a measurement. If you don't have a instrument shelter, place the hygrometer in a shaded area with airflow.
- Your shelter should be located in an open area without obstructions such as trees and other buildings, and within walking distance.
- Your instrument shelter should be clean both inside and out.

Installed Instrument Shelter

Collecting Data: Hygrometer

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

- 1) Preferably within an hour of local solar noon, open the instrument shelter and place the hygrometer in the instrument shelter.
- 2) After 30 minutes, record the time and date on your Atmosphere data sheet in both local or Coordinated Universal Time (UTC) time. Note: GLOBE website data entry only accepts either local or UTC time.
- 3) Read the relative humidity to the nearest 1% and note the instrument used.
- 4) Read the current temperature (if your reading is not being taken at the same time as the daily reading of maximum, minimum, and current temperature).
- 5) Return the hygrometer to the classroom, and store it in a dry place.

When Not to Collect Data: Hygrometer

- A. What is relative humidity?
 - B. Why collect relative humidity data?
 - C. How your measurements can help!
 - D. How to collect your data.
 - E. How to report data to GLOBE.
 - F. Understand the data.
 - G. Quiz yourself!
 - H. Further resources.
- *If there is fog or it is raining or snowing, the relative humidity is at 100%; record 100% on your data sheet and put “condensation occurring” in comments.*

Collecting Data: Sling Psychrometer- 1

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

- 1) Stand far enough away from other people and the instrument shelter so you will not hit them with the psychrometer. Stand in the shade if possible with your back to the sun. If there is no shade near the shelter, move to a shady spot nearby, but not too close to trees or buildings.
- 2) Keep the sling psychrometer as far away as possible from your body to prevent body heat from changing the temperature readings. This is very important in cold weather. Do not touch or breathe on the temperature-sensing parts of the thermometer as this, too, may affect the reading. If possible, face into the wind to minimize the impact on the measurement from your body heat.
- 3) Open the sling psychrometer case by pulling out the slider, which contains the two thermometers.
- 4) Wait 3 minutes to allow the thermometer to read the current air temperature and then read the current dry bulb temperature to 0.5° C using the thermometer with no wick attached. Make sure your eyes are level with the instrument.
- 5) Record the dry bulb temperature.

Collecting Data: Sling Psychrometer- 2

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

- 6) Check to be sure that there is still distilled water in the reservoir, and that the wick is wet. If it is dry, add distilled water to the reservoir.
- 7) Sling the psychrometer for 3 minutes.
- 8) Let the psychrometer stop whirling on its own! Do not stop it with your hand or other object.
- 9) Read the wet bulb temperature to 0.5° C (from the thermometer with the wick attached).
- 10) Record the wet bulb temperature.
- 11) Determine the relative humidity using a [psychrometric chart](#) or the sliding scale found on the cases of some psychrometers. You may also leave this blank as GLOBE can calculate relative humidity from your wet and dry bulb temperatures.
- 12) When you are done with the instrument, close it up and return it to the shelter properly.

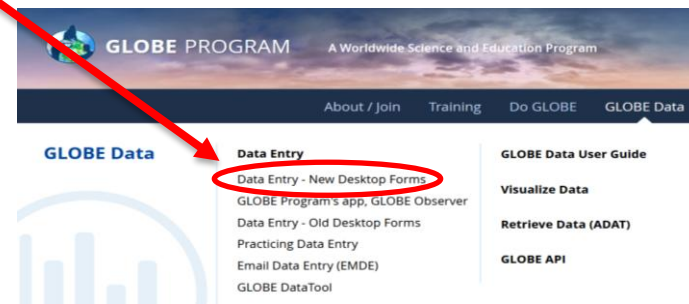

Entering Relative Humidity Data in the GLOBE Observer Data Entry System

Two Options for Uploading Data:

These methods all allow users to submit environmental data – collected at defined sites, according to protocol, and using approved instrumentation – for entry into the official GLOBE science database.

1. Download the GLOBE Observer mobile app from the [App Store](#).
2. Data Entry: Visit globe.gov, click on the “GLOBE Data” tab, then underneath “Data Entry” click on “Data Entry – New Desktop Forms”.

Note 1: You will need a GLOBE teacher, trainer, or scientist account to submit GLOBE data.

Note 2: It may take some time after you enter your data for it to appear in the GLOBE data visualization system.

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

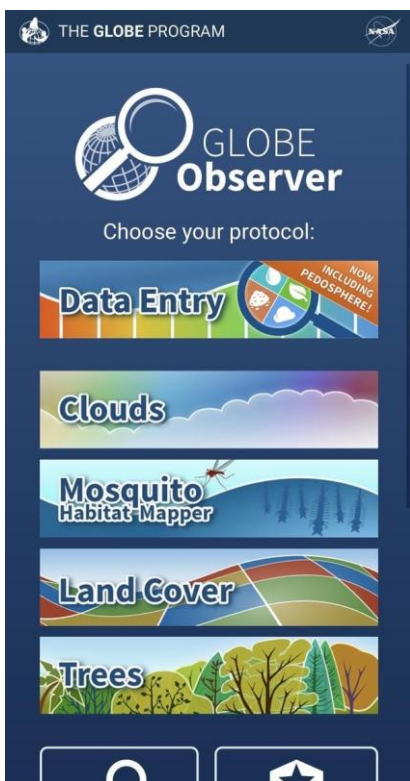

H. Further resources.

Entering Relative Humidity Data – Step 1&2

The steps below will walk you through entering your Atmosphere Study Site Information in the GLOBE Observer App, which you can access using your GLOBE or GLOBE Observer login.

1. Click "Data Entry"

2. Click "Create/Edit My Sites"

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

Entering Relative Humidity Data – Step 3

3. Click on the arrow next to "Atmosphere" and select "Relative Humidity"

Select Protocols

▼ Atmosphere 1

- Aerosols
- Air Temperature
- Barometric Pressure
- Clouds
- Precipitation
- Relative Humidity
- Surface Temperature
- Water Vapor
- Wind

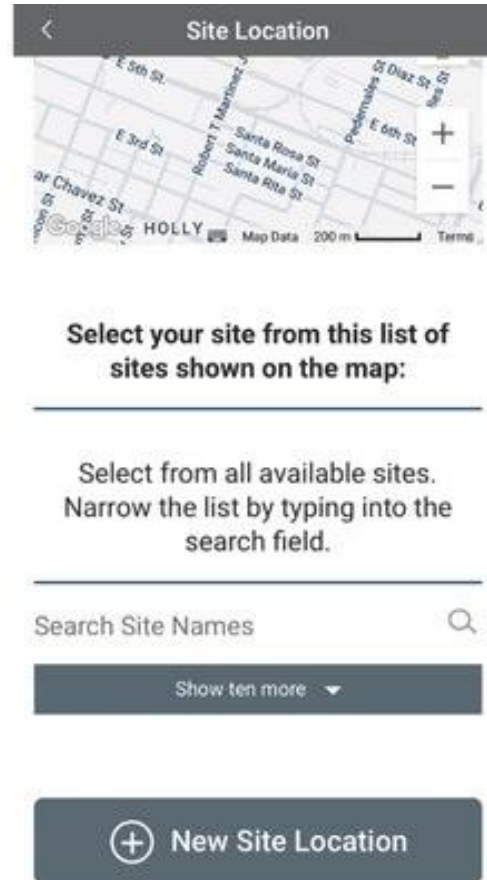

* Required for one or more selected protocols

- A. What is relative humidity?
- B. Why collect relative humidity data?
- C. How your measurements can help!
- D. How to collect your data.
- E. How to report data to GLOBE.
- F. Understand the data.
- G. Quiz yourself!
- H. Further resources.

Entering Relative Humidity Data – Step 4

4. At the bottom of the screen, click “*Continue*”. When prompted, enter site location details (latitude, longitude, and elevation). Choose an existing site or identify a new site by clicking “+ *New Site Location*”

- A. What is relative humidity?
- B. Why collect relative humidity data?
- C. How your measurements can help!
- D. How to collect your data.
- E. How to report data to GLOBE.
- F. Understand the data.
- G. Quiz yourself!
- H. Further resources.

Entering Relative Humidity Data – Step 5

5. Check to see if the “Date and Time” are correct, if it is not, click “Get Current Time” to update it. Then click “Relative Humidity” to move on

<
Date and Time

Enter the local date and time of the observation:

Local Date:

2025-11-15

📅

Local Time (24hr):

02:03:00

🕒

Get Current Time

Observation Date:
2025-11-15 UTC

Observation Time:
07:03 UTC

Solar Noon:

- H. Further resources.

Visualize and Retrieve Data – Step 1

GLOBE provides the ability to view and interact with data measured across the world. Select our [visualization tool](#) to map, graph, filter and export data that have been measured across GLOBE protocols since 1995.

These step-by-step tutorials on using the visualization system will assist you in finding and analyzing data: [PDF version](#) [PowerPoint version](#)

<http://vis.globe.gov/GLOBE/>

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

Visualize and Retrieve Data – Step 2

Select the date for which you need data, add the protocol layers, and you can see where data is available.

The screenshot shows the GLOBE Visualization System interface. The top navigation bar includes 'Measurements' and 'Data Counts'. A date selector is set to '2025-11-15'. The 'Protocol Layers' section is expanded, showing a list of protocols. The 'Relative Humidity' protocol is selected, and the 'Relative Humidity' sub-option is checked. A map of Canada is visible in the background.

Protocol Layers

Choose a Sphere below to see protocols. From there, open each protocol to see the available data layers that can be added to the map.

Check to select Protocols **SUBMIT**

Understanding the Data

This graphic from the GLOBE database shows the relationship between air temperature and relative humidity for Tallahassee, FL. Note that as air temperature goes up throughout the day, relative humidity goes down and the opposite occurs in the evening.

 - B. Why collect relative humidity data?
 - C. How your measurements can help!
 - D. How to collect your data.
 - E. How to report data to GLOBE.
 - F. Understand the data.**
 - G. Quiz yourself!
 - H. Further resources.
- How are *your* relative humidity observations related to air temperature?
 - Can you find other GLOBE sites at your latitude which are closer to or further from large bodies of water? Do you see any systematic differences in relative humidity between your location and the others?
 - Does relative humidity affect any non-atmosphere parts of your local environment? How?
 - At what time of day will relative humidity normally be at a maximum? minimum?
 - Are your relative humidity and phenology measurements related?

What have you learned?

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

- 1) What is relative humidity?
- 2) Why is it important to collect relative humidity data?
- 3) What instruments can you use to collect relative humidity?
- 4) Where should you place your instrument?
- 5) When should you take your measurements?
- 6) What data sheet will you use?
- 7) Describe the procedure in collecting relative humidity.
- 8) How do you enter data on the GLOBE website?
- 9) What are some questions you could use to investigate relative humidity in the visualization part of GLOBE?
- 10) What data layer would you need to add?

Frequently Asked Questions (FAQs)

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. **Further resources.**

1. Why do you have two different methods of measuring relative humidity?

Two methods are used to try to provide an incentive for the teacher and student to make a determination about how much time is desired taking the observations. One is more complex (and fun) than the other. Observations from either method are equally valuable to the GLOBE program and scientists, in general.

2. Why do we need to take the hygrometer inside each day, and bring it out to the weather shelter 30 minutes before we make our local solar noon observations?

The sensitive electronics inside the hygrometer cannot be exposed to condensation for long periods of time, so it is best to avoid all situations when condensation may be expected. If fog or persistent rainfall is occurring at the time of observation, it is best not to take the hygrometer outside; rather, the observer should report a relative humidity of 100%, but also should make a comment in the metadata that the observation was inferred based on visible condensation in the air (rain or fog).

Frequently Asked Questions (FAQs)

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. Further resources.

3. I see the definitions for wet-bulb and dry-bulb temperature; what is the dew point temperature?

The dew point temperature is the temperature to which air must be cooled to achieve saturation (relative humidity = 100%) given its current water content. Dew point is a measure of the actual water vapor content. On calm clear days followed by calm clear nights, the temperature will fall rapidly towards the dew point. Unless dew forms, if the air temperature reaches the dew point temperature, fog may form. Once dew or fog forms, the dew point temperature will fall, because there is less water vapor in the air.

4. Why can't we use the sling psychrometer below freezing?

The relationship between evaporation rate and temperature is more complicated below freezing than above freezing, so the sling psychrometer will not be as practical. More expensive models that have greater ranges are available, but are beyond the reach of the expected school budgets for instruments. We recommend the use of a hygrometer for locations that have frequent temperatures below freezing.

Frequently Asked Questions (FAQs)

A. What is relative humidity?

B. Why collect relative humidity data?

C. How your measurements can help!

D. How to collect your data.

E. How to report data to GLOBE.

F. Understand the data.

G. Quiz yourself!

H. **Further resources.**

5. How accurate are these relative humidity readings, compared to those that might be taken with more expensive instruments?

The hygrometer will report relative humidity with an accuracy range of 2-4%, within the desired 5% figure. The sling psychrometer reports temperature to within an accuracy of approximately 0.5° C; provided the calibration on the thermometers is maintained, this also ensures accuracy better than 5% over the most common range of values of relative humidity, between 20-95%.

6. The reservoir on the left side of the instrument (holding the wick) is either broken or cracked (nearly broken); is there a way to still use it?

Yes. The plastic reservoir end cap that holds the wick inside can become weak. The instrument is still useable; however some simple repairs or precautionary effort must be done. Taping a piece of cardboard on the end will usually hold the wick inside and not affect the readings.

7. Is there a special way that we should store our sling psychrometer?

In order to prevent the liquid separating in the thermometers, it is suggested that you store the sling psychrometer in a jar or other receptacle so that the thermometers are resting with the lower temperatures at the bottom.
